

Fingertip Units for Topical Steroids

Topical steroids are used for various skin conditions. The amount of topical steroid that you should apply is commonly measured by 'fingertip units'.

What are topical steroids and how do they work?

Topical steroids are creams, ointments and lotions which contain steroid drugs. Topical steroids work by reducing inflammation in the skin. They are used for various skin conditions. Unlike many other creams and ointments, it is important to get the dose right when using topical steroids. This is why a standard measure is often used - the fingertip unit.

Fingertip units

One fingertip unit (FTU) is the amount of topical steroid that is squeezed out from a standard tube along an adult's fingertip. (This assumes the tube has a standard 5 mm nozzle.) A finger tip is from the very end of the finger to the first crease in the finger.

One FTU is enough to treat an area of skin twice the size of the flat of an adult's hand with the fingers together.

Two FTUs are about the same as 1 g of topical steroid. Therefore, for example, say you treat an area of skin the size of eight adult hands. You will need four FTUs for each dose. (This is 2 g per dose. If the dose is once a day, then a 30g tube should last about 15 days of treatment.)

The following are further examples:

Area of skin to be treated (adults)	Size is roughly:	FTUs each dose (adults)
A hand and fingers (front and back)	About 2 adult hands	1 FTU
A foot (all over)	About 4 adult hands	2 FTUs
Front of chest and abdomen	About 14 adult hands	7 FTUs
Back and buttocks	About 14 adult hands	7 FTUs
Face and neck	About 5 adult hands	2.5 FTUs
An entire arm and hand	About 8 adult hands	4 FTUs
An entire leg and foot	About 16 adult hands	8 FTUs
